Problem

- Students needing a tool to easily find requirements for their desired university
- Websites only give general outlines that can be misleading to what competitive requirements are e.g. myblueprint
- There are ways to find how other students got into certain programs but information is usually fragmented or scattered e.g. mouth to mouth, online forums, and different year requirements
- There are already community made datasheets however it's not always apparent/accessable to the public

Solution

- We decided to make an App/Website hybrid platform that helps students find their way through post secondary applications
- This platform will include intuitive UI and navigation so that students can find their way through, effortlessly
 - The platform also features smart capabilities such as being able to track student's grades and interests and using that information to locate suitable institutions/courses that the student might enjoy or excel at
- The information on this platform will come from a wide range of sources as well as official postings by individual institutions

Implementation

- Scrape public sources (University data displays or community spreadsheets) for data such as admission program categories, accepted averages, and extracurriculars/additional qualifications.
- Find an API if possible
- Organize information so that they can be categorically searched based on things like location, career field, or admission difficulty.

- Students can build their own profile and the project will match the profile based on user preferences and tell students their odds of getting into programs based on profile (might be a bit hard to take extracurriculars into account though that can be added on later)
- Profiles will be saved on an account and creation of profiles will have a survey to build the student's parameters (what grades they have, fields of interest, type of lifestyle they want, tuition, etc...)
- Build the whole thing in like TypeScript as a website most likely hosted on GitHub
- Search system for the database of our information so that students can look up uni/college according to their filters.
- Commenting system for students that already got into programs to input their stats.
-  2025-2026 University Applications (offers, rejections, deferrals) (Responses)
